

IDENTITY CORRELATION REPORT

CONFIDENTLY MANAGE CONTACT TRACING EFFORTS WITH UNIFIED ACCESS CONTROL & VIDEO SECURITY TECHNOLOGY

The Identity Correlation Report in the Avigilon Access Control Manager (ACM) solution offers a reliable and accurate tool to help with contact tracing across a facility. The report details locations across a secured site that a potentially infectious identity has been, along with all other identities who have been in the same locations during a specified period of time. The associated names of all these identities are presented together in the report, providing facility managers accurate information they can use to respond to potential exposures that can lead to cross contamination and community transmissions.

EASILY RETRACE STEPS OF INFECTED IDENTITIES

Forensically retrace the chain-of-events from the initial point of contamination and rebuild the sequence of events to inform response efforts.

UNIFIED WITH VIDEO SECURITY

Supplement Identity Correlation Reports with video evidence. Identity Search can confirm the doors that the identity in question attempted to access. Expand your search with Avigilon Appearance Search™ technology to understand other areas of the facility where the identity may have visited.

Avigilon's unified video and access control solution enables you to validate the report details with video evidence. The report of names serves as the basis for launching an Identity Search and Appearance Search to confirm the identity of the person, verify whether they physically touched the door handle surface after presenting their credentials and mapping all other locations and people they may have come in contact with. These technologies offer an added measure of safety by generating timelines and video clips of these events to enrich the data found in the Identify Correlation Reports.
